

Is digital imaging better than film?

Film imaging uses silver salts and numerous chemicals that are harmful enough to be regulated by the EPA. The true health effects of these chemicals are, even after all these years, unknown. We believe that digital imaging is far more eco-friendly. In quality terms, many digital imaging systems now equal or exceed the technical specifications of film. While e-waste is always an issue, digital cameras are often resold, handed down and otherwise kept from landfills. According to most experts, digital printing, including inkjet, is believed to be more eco-friendly than traditional darkroom and film-to-plate printing.
